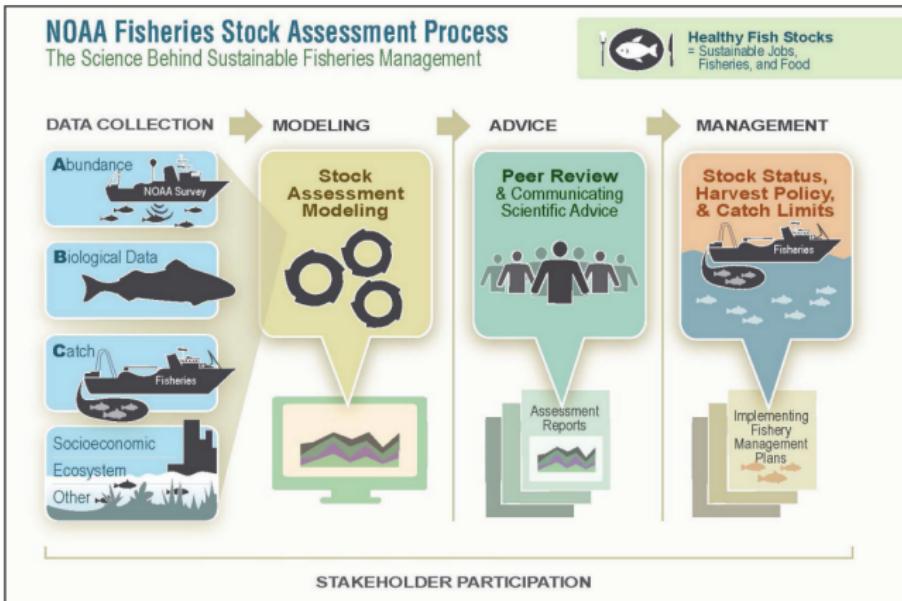

Figure 1: Overview of the stock assessment process from data collection through the provision of scientific advice to fishery managers. Stakeholders and other partners participate in each step of the assessment process. This report captures NOAA Fisheries products associated with the 'Advice' phase of the process.

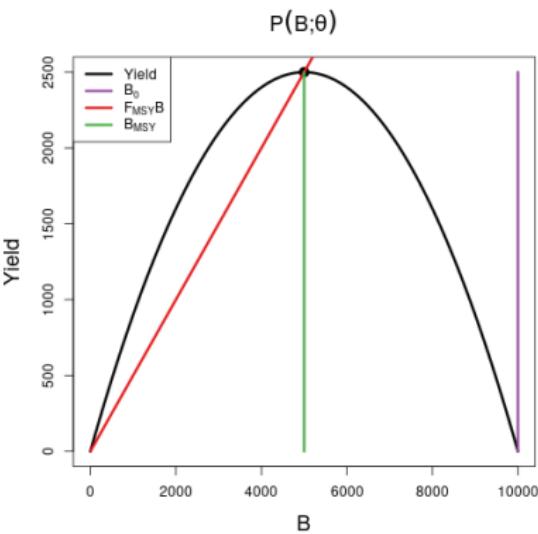

Surplus Production Model General Structure

$$I_t = qB_t e^\epsilon \quad \epsilon \sim N(0, \sigma^2).$$

$$\frac{dB}{dt} = P(B(t); \theta) - Z(t)B(t).$$

Reference Points:

- Maximum sustainable Yield (*MSY*)
- F_{MSY}^a : Fishing rate to achieve *MSY*
- $\frac{B_{MSY}}{B_0}$: Biomass Depletion when at *MSY*
- Driven by the shape of P as determined by θ .

^aor $\frac{F_{MSY}}{M}$

Conceptually:

$$\frac{F_{MSY}}{M} \in \mathbb{R}^+ \quad \frac{B_{MSY}}{B_0} \in (0, 1)$$

- Schaefer Model:

$$F_{MSY} \in \mathbb{R}^+ \quad \frac{B_{MSY}}{B(0)} = \frac{1}{2}$$

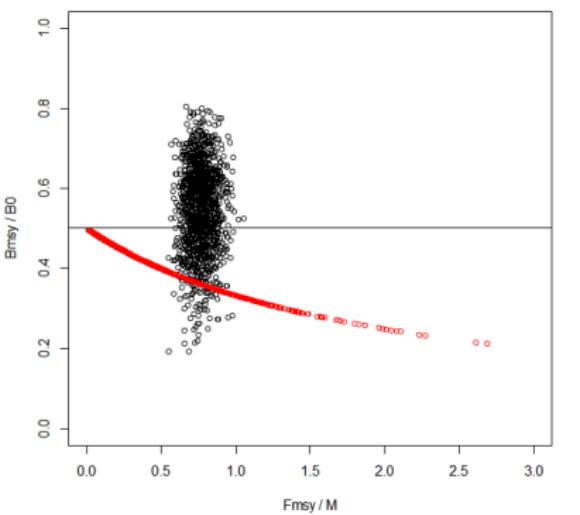

- BH Model:

$$\frac{F_{MSY}}{M} \in \mathbb{R}^+ \quad \frac{B_{MSY}}{B(0)} = \frac{1}{F_{MSY}/M + 2}$$

- Similar Constraints for other Two-Parameter Models:

Fox, Ricker, etc...

- Three-Parameter Models Allow Independent RP Estimation

- Observation model
- introduce logistic P
- something else?

$$P_\ell(B; [r, K]) = rB \left(1 - \left(\frac{B}{K}\right)\right)$$

$$F^* = \frac{r}{2}$$

$$B^* = \frac{K}{2} \quad B_0 = K$$

$$\frac{B^*}{B_0} = \frac{1}{2}$$

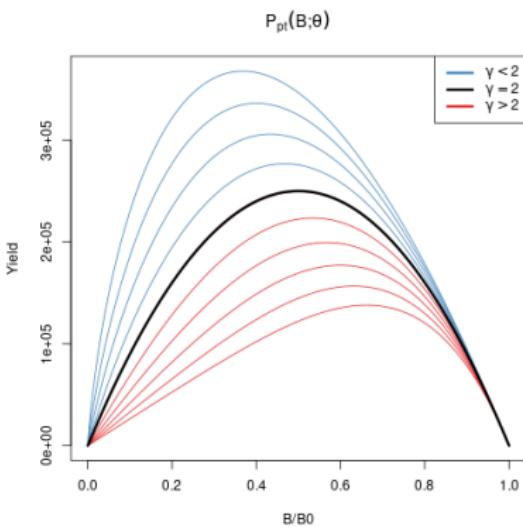

$$P_{pt}(B; [r, K, \gamma]) = \frac{rB}{\gamma - 1} \left(1 - \left(\frac{B}{K} \right)^{(\gamma - 1)} \right)$$

$$F^* = -\frac{r}{\gamma}$$

$$B^* = K \left(\frac{1}{\gamma} \right)^{\frac{1}{\gamma-1}} B_0 = K$$

$$\frac{B^*}{B_0} = \left(\frac{1}{\gamma}\right)^{\frac{1}{\gamma-1}}$$

$$F^* = \frac{r}{\gamma} \quad \frac{B^*}{\bar{B}(0)} = \left(\frac{1}{\gamma} \right)^{\frac{1}{\gamma-1}} \quad (1)$$

invert simulation design

$$r = \gamma F^* \quad \gamma = \frac{W \left(\frac{B^*}{\bar{B}(0)} \log \left(\frac{B^*}{\bar{B}(0)} \right) \right)}{\log \left(\frac{B^*}{\bar{B}(0)} \right)} \quad (2)$$

Introduce simulation

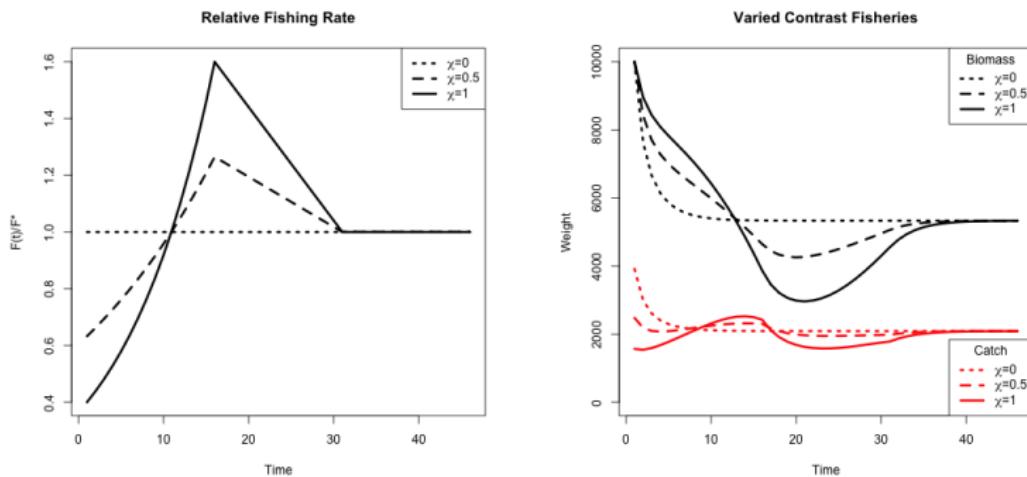

Figure: (left) Relative fishing with low, medium, and high contrast.
(right) Population biomass and catch at each associated level of contrast.

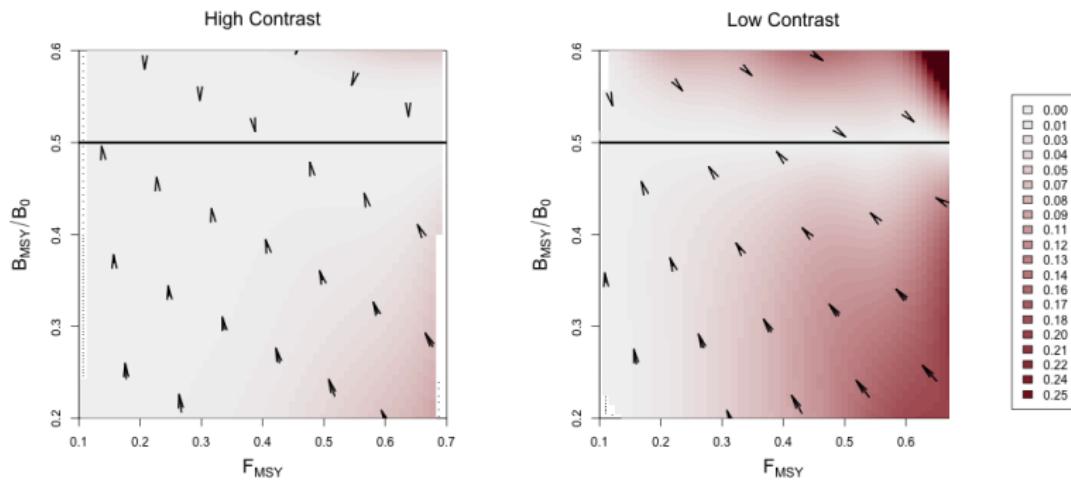

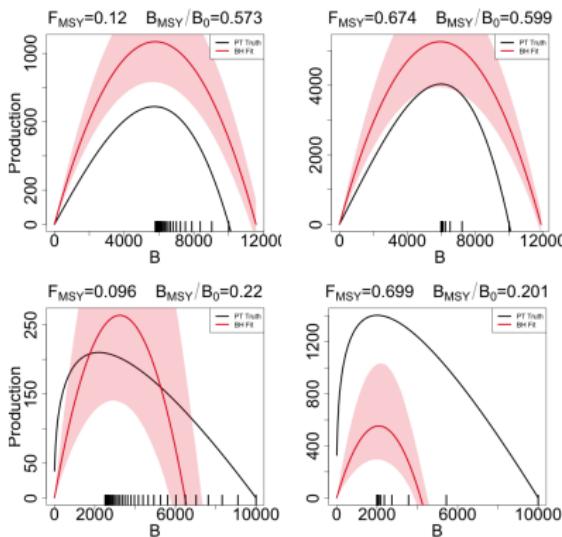

Figure: Joint bias direction for $(F^*, \frac{B^*}{B_0})$ estimates under the misspecified Schaefer Model. The intensity of color represents the excess bias relative to the shortest possible mapping. Results in the low contrast setting are shown *right*, and the high contrast setting is shown *left*.

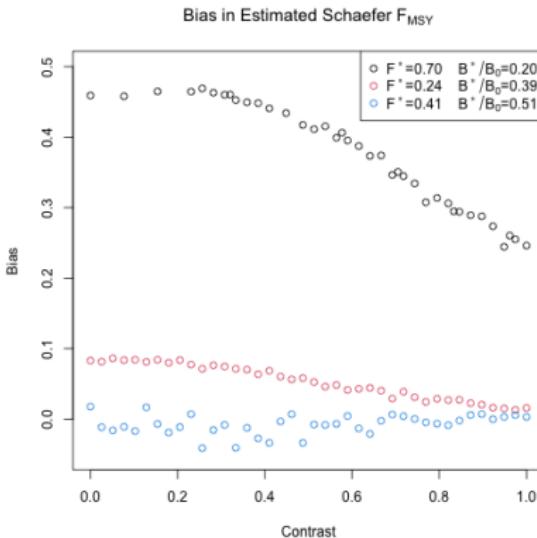

Mechanism for Bias in F_{MSY} via Contrast

- Only observe upper half
- learn about slope at origin from upper biomass range

Mechanism for Bias in F_{MSY} via Contrast

Mangel et al.

Fig. 4. DeYoreo et al. (2012) used both a BH-SRR and three-parameter SRR, similar to the S-SRR in a stock assessment of cowcod (*Sebastodes levis*). We show samples from posterior distributions arising from different values of steepness. Unlike most stock assessments, we plot B_{MSY}/B_0 versus F_{MSY}/M . The grey circles show the results for the BH-SRR. This curve is another way of representing the constraint placed on a stock assessment by using a BH-SRR and specifying steepness — results must lie along this curve. The black circles represent the outcome of the three-parameter SRR. The black X represents the result when steepness is asserted to be 0.6.
