General Surplus-Production Structure

$$I_t = qB_te^{\epsilon} \quad \epsilon \sim N(0, \sigma^2)$$

$$\frac{dB(t)}{dt} = P(B(t); \theta) - Z(t)B(t)$$

$$RP: MSY, \ \frac{F_{MSY}}{M}, \ \frac{B_{MSY}}{B_0}$$

Yield and Related Quantities

Conceptually:

Introduction

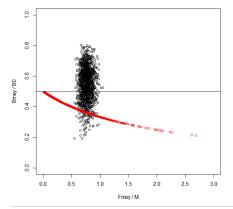

$$\frac{F_{MSY}}{M} \in \mathbb{R}^+ \quad \frac{B_{MSY}}{B_0} \in (0,1)$$

Mangel et al. 2013, CJFAS:

■ BH Model:

$$\frac{F_{MSY}}{M} \in \mathbb{R}^+$$
 $\frac{B_{MSY}}{B(0)} = \frac{1}{F_{MSY}/M+2}$

Similar Constraints for other Two-Parameter Curves

- Similar Constraints for other Two-Parameter Curves
- Three-Parameter Relationships Allow Independent RP Estimation

- Isolalting RP Bias is Hard:
 - Chaos in the Dynamical System
 - Time Integrator Inaccuracy
 - Model Identifiability
 - Global Optimization
 - etc...
- Production Models are simplified places to build intuition

$$\frac{dB}{dt} = P(B; \theta) - (M + F)B$$

$$P(B; [\alpha, \beta, \gamma]) = \alpha B(1 - \beta \gamma B)^{\frac{1}{\gamma}}$$

$$\gamma = -1 \Rightarrow \mathsf{Beverton\text{-}Holt}$$

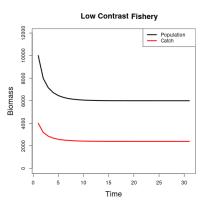

$$\gamma \to 0 \Rightarrow \mathsf{Ricker}$$

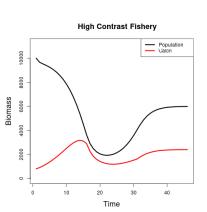

$$\gamma = 1 \Rightarrow \mathsf{Logistic}$$
